| 15 | ~250 words |

## Answer Hint

**High-speed connectivity, transit-oriented development, regional economic corridors, technology transfer, land acquisition, financial viability, environmental sustainability**

## Model Answer

### Introduction

High-speed rail (HSR), exemplified by the Mumbai–Ahmedabad corridor, can transform inter-city mobility by reducing travel time and strengthening economic linkages between urban centres.

### Contributions to Development

1. **Regional economic integration:** Faster connectivity facilitates business travel, labour mobility, tourism and trade, linking major economic centres with intermediate cities.
2. **Transit-oriented development:** Stations can promote planned urban growth, commercial hubs and integrated public transport networks.
3. **Industrial development:** Construction creates demand for steel, engineering and infrastructure services, while technology transfer can strengthen domestic manufacturing capabilities.

4. **Environmental benefits:** Electrified rail can reduce dependence on road and air transport, potentially lowering emissions per passenger, particularly when powered by cleaner electricity.
5. **Urban productivity:** Reduced travel time can expand access to employment, education and specialised healthcare.

## Key Concerns

1. **Financial viability:** High capital costs and uncertain passenger demand may create long-term fiscal and operational pressures.
2. **Land acquisition:** Large infrastructure requirements can cause displacement and livelihood losses.
3. **Uneven development:** Benefits may concentrate around major stations unless smaller cities are effectively integrated.
4. **Environmental impact:** Construction-related emissions, land fragmentation and ecological disturbance require assessment.

## Way Forward

1. Adopt transparent cost-benefit assessments and phased implementation.
2. Integrate HSR stations with metros, buses and regional rail.
3. Ensure fair compensation, rehabilitation and environmental safeguards.
4. Promote indigenous manufacturing and technology absorption.

## Conclusion

High-speed rail should be viewed as part of an integrated mobility and regional development strategy. Its success depends not merely on speed, but on accessibility, financial sustainability and inclusive growth.
